Research Interest

My research centers on training intelligent robotic agents that align closely with human intentions. To achieve this, I leverage Reinforcement Learning (RL) to develop robotic agents capable of learning human-aligned behaviors in various tasks. A key focus of my work has been designing reward learning algorithms that accurately capture human intent, either through direct human feedback or by grounding in vision-language foundation models. More recently, I have emphasized advancing RL methods themselves to better support the training of such human-aligned robotic agents.
